

Remove your bottlenecks and unleash the power of SAP

SAP and other ERP systems offer unparalleled solutions to manage the complex and diverse needs of asset intensive operations. These tools can significantly increase efficiencies, save costs and improve compliance.

However, the integrity of these solutions suffers when vital information hasn't been entered into the system. Think paper-based work orders and other documents from the field.

It's common for supervisors, managers and leaders to struggle to find the time to scan and/or rekey their paper-based forms. These administrative delays and bottlenecks are almost unavoidable when using manual systems.

The question is: What are these administrative delays really costing your team, maintenance function and organisation?

The truth is that ERP systems, including SAP, are simply less effective without access to the whole picture. So many decisions and processes are compromised by missing data – from compliance reporting through to financial performance.

But it doesn't need to be that way. A contemporary field mobility solution like Obzervr helps you digitally capture data in the field and seamlessly upload this information into your ERP with minimal delays.

If you'd like to know more about removing the administrative burden and unleashing your ERP's power, please reach out to Obzervr.
